## Problem Set 1

## CS 331H

## Due Thursday, January 28

## General rules:

- For full credit, you must justify your work; if it is not obvious, a proof should be provided.
- Collaboration is encouraged, but you must write up the solutions on your own and acknowledge your collaborators at the top of your solutions.
- 1. Recursive time bounds: give a big-O bound for T(n) given each of the following recursive formulas:
  - (a)  $T(n) = 3T(n/4) + n \log n$
  - (b)  $T(n) = 2T(n/2) + \sqrt{n}$
  - (c) T(n) = 5T(n/4) + n
  - (d) T(n) = T(2n/3) + T(n/3) + n/6.

with the base case T(1) = 1.

2. [Exercise 0.2 of http://jeffe.cs.illinois.edu/teaching/algorithms/]

Careful readers might complain that our analysis of songs like "n Bottles of Beer on the Wall" or "The n Days of Christmas" is overly simplistic, because larger numbers take longer to sing than shorter numbers. More generally, because there are only so many words of a given length, larger sets of words necessarily contain longer words. We can more accurately estimate singing time by counting the number of syllables sung, rather than the number of words.

- (a) How long does it take to sing the integer n?
- (b) How long does it take to sing "n Bottles of Beer on the Wall"?
- (c) How long does it take to sing "The n Days of Christmas"?

As usual, express your answers in the form O(f(n)) for some function f.

3. There's a Jupyter Notebook linked from the class webpage. Run through it, then answer the questions at the end. Don't wait till the last day to do this: setting up the required libraries may take some time.
