

1. Expressions. 1 point each, 18 points total. For each Java expression in the left hand column, indicate the result of the expression in the right hand column.

You must show a value of the appropriate type. For example, 7.0 rather than 7 for a double and "7" instead of 7 for a String. Answers that do not indicate the data type correctly are wrong.

2. Code tracing. 2 points each, 18 points total. Place your answer in the box to the right of the code. If the code results in a compiler or runtime error, state the kind of error that occurs.

A. What is output by the following code when it is run?

```
int xa = 2;
int ya = 3 + xa * 2;
xa++;
ya -= (ya + xa);
xa *= 2 + 1;
System.out.print(xa + " " + ya);
```

F. How many asterisks does the following code print out?
Don't show the output. Simply state the number of asterisks that are printed out when the code runs.

```
for(int i = -5; i <= 3; i++) {
    System.out.print("*");
}
```

G. How many asterisks does the following code print out?
Don't show the output. Simply state the number of asterisks that are printed out when the code runs.

```
for(int ig = 1; ig <= 8; ig++) {
    for(int jg = 5; jg > 0; jg--) {
        System.out.print("*");
        System.out.print("*");

H. How many asterisks does the following code print out?
Don't show the output. Simply state the number of asterisks that are printed out when the code runs.

```
for(int ih = 0; ih < 4; ih++) {
    System.out.print("*");
    for(int jh = 0; jh < ih; jh++) {
        System.out.print("*");

I. What is output by the following code when it is run?

```
double ai = 1.7;
double bi = -2.5;
if(ai <= Math.abs(bi))
    System.out.print("A");
if(Math.pow(1.7, 5.0) > 1)
    System.out.print("B");
if(Math.floor(ai) > Math.ceil(bi))
    System.out.print("C");
if(Math.floor(bi) < Math.ceil(bi))
    System.out.print("D");
```

3. Syntax errors. 10 points. Each of the following code snippets contains a syntax error. Explain what the syntax error is in a single sentence.

A.

```
for(int final = 0; final < 10; final++) {  
    int x = 10;  
    System.out.print(x++ * 10);  
}
```

// What causes the syntax error?

B.

```
String st = "";  
int x = 5;  
int y = -3; -15  
st = x * y + "res-" + x - y + "x" + "\\n";  
System.out.print(st + x);  
// What causes the syntax error?
```

$5 * -15 \text{ res} - 5 - (-3)$

C.

```
int yg;  
yg = 3;  
int 2x = yg * 10;  
System.out.print(Math.pow(yg, 2x));  
// What causes the syntax error?
```

D.

```
int m = 3;  
int n;  
int o = 5;  
m * = n + o;  
System.out.print(m);  
// What causes the syntax error?
```

$m * (n + o)$

E.

```
double ah = 12;  
int xh = ah / 4;  
double bh = xh * 3;  
for(int i = 0; i < ah; i++)  
    System.out.print("***");  
// What causes the syntax error?
```

Programming and Loops. 20 points. Write a Java method to produce the following output.
The method relies on a parameter named size.

When the parameter size is 3 the output is:

```

- * -
- * * -
- * * * -
  
```

lines = size

When the parameter size is 5 the output is:

```

-----*-----
-----***-----
-----*****-----
-----*****-----
*****
  
```

q4(4)

Complete your method, including the method header, in the space provided:

```
public static void q4(int size) {
```

```

    for (int line = 1; line <= size; line++) {
        for (int dash = 0; dash < size - 1 - line; dash++) {
            print("-");
        }
        for (int star = 0; star < 1 + 2 * line; star++) {
            print("*");
        }
        for (int dash = 0; dash < size - 1 - line; dash++) {
            print("-");
        }
        println();
    }
}
  
```

int numDashes = size - 1

1. Method Tracing and Parameters Simulation. 10 points.

Consider the following methods that are all part of the same program:

```
public static void a(int x, int y) {
    int z = x;
    x *= 2;
    y /= 2;
    System.out.print(x + " " + y + " " + z);
    x = z - 2;
}
```

x=2, y=10, z=2
x=4, y=5, z=2

```
public static int b(int x, int y) {
    y = x - y;
    x++;
    return x * y;
}
```

x=2, y=3
y=4, x=3
return 12

```
public static int c(int x, int y) {
    int r = b(x, y);
    int s = b(y, x);
    r += 2 + x;
    s = y - s;
    return r + s;
}
```

```
public static int d(int i) {
    i--;
    i *= 2;
    System.out.print(i + " ");
    return i - 2;
}
```

A. Given the methods above, what is output by the following code?

```
int x = 2;
int y = 3;
