# Overview

- Part of [Nvidia Performance Libraries](#)
  - Initial release NVPL 23.11 (Nov'23)
  - [Latest](#) release NVPL 24.7 (Jul'24)
- API
  - Standard Netlib API: F77 and C
  - Extra: batch GEMM, threading control, verbosity, ...
- Interface
  - LP64 and ILP64 interfaces
    - Switched with `-DNVPL_ILP64` compiler flag
  - Different thread runtime: sequential and OpenMP (any vendor)
- Implementation
  - Runtime dispatching based on CPU architecture
- Inspiration: BLIS, Intel MKL, ArmPL

```

NVPL_BLAS_VERBOSE: NVPL BLAS version 0.1.0
NVPL_BLAS_VERBOSE: Platform: Neoverse V2, cores:72 sve_width:128. Cache: L1:64 KB (cl:64 ways:4 sets:256) L2:1024 KB
NVPL_BLAS_VERBOSE: dgemm_(N,N,128,256,123,2,0xffffdddb62000,128,0xffffdddb12000,123,-1,0xffffdddac2000,128) time_us:4742

```

# Library Architecture

**Name:** libnvpl\_blas\_{,i}lp64\_{seq,gomp}.so

**Symbol mangling:** nvpl\_blas\_\* (except for BLAS)

**Responsibilities:**

- Int32 / Int64 APIs
  - Switched with -DNVPL\_ILP64
- Threading RT
- Verbose

**Depends:** core, threading rt

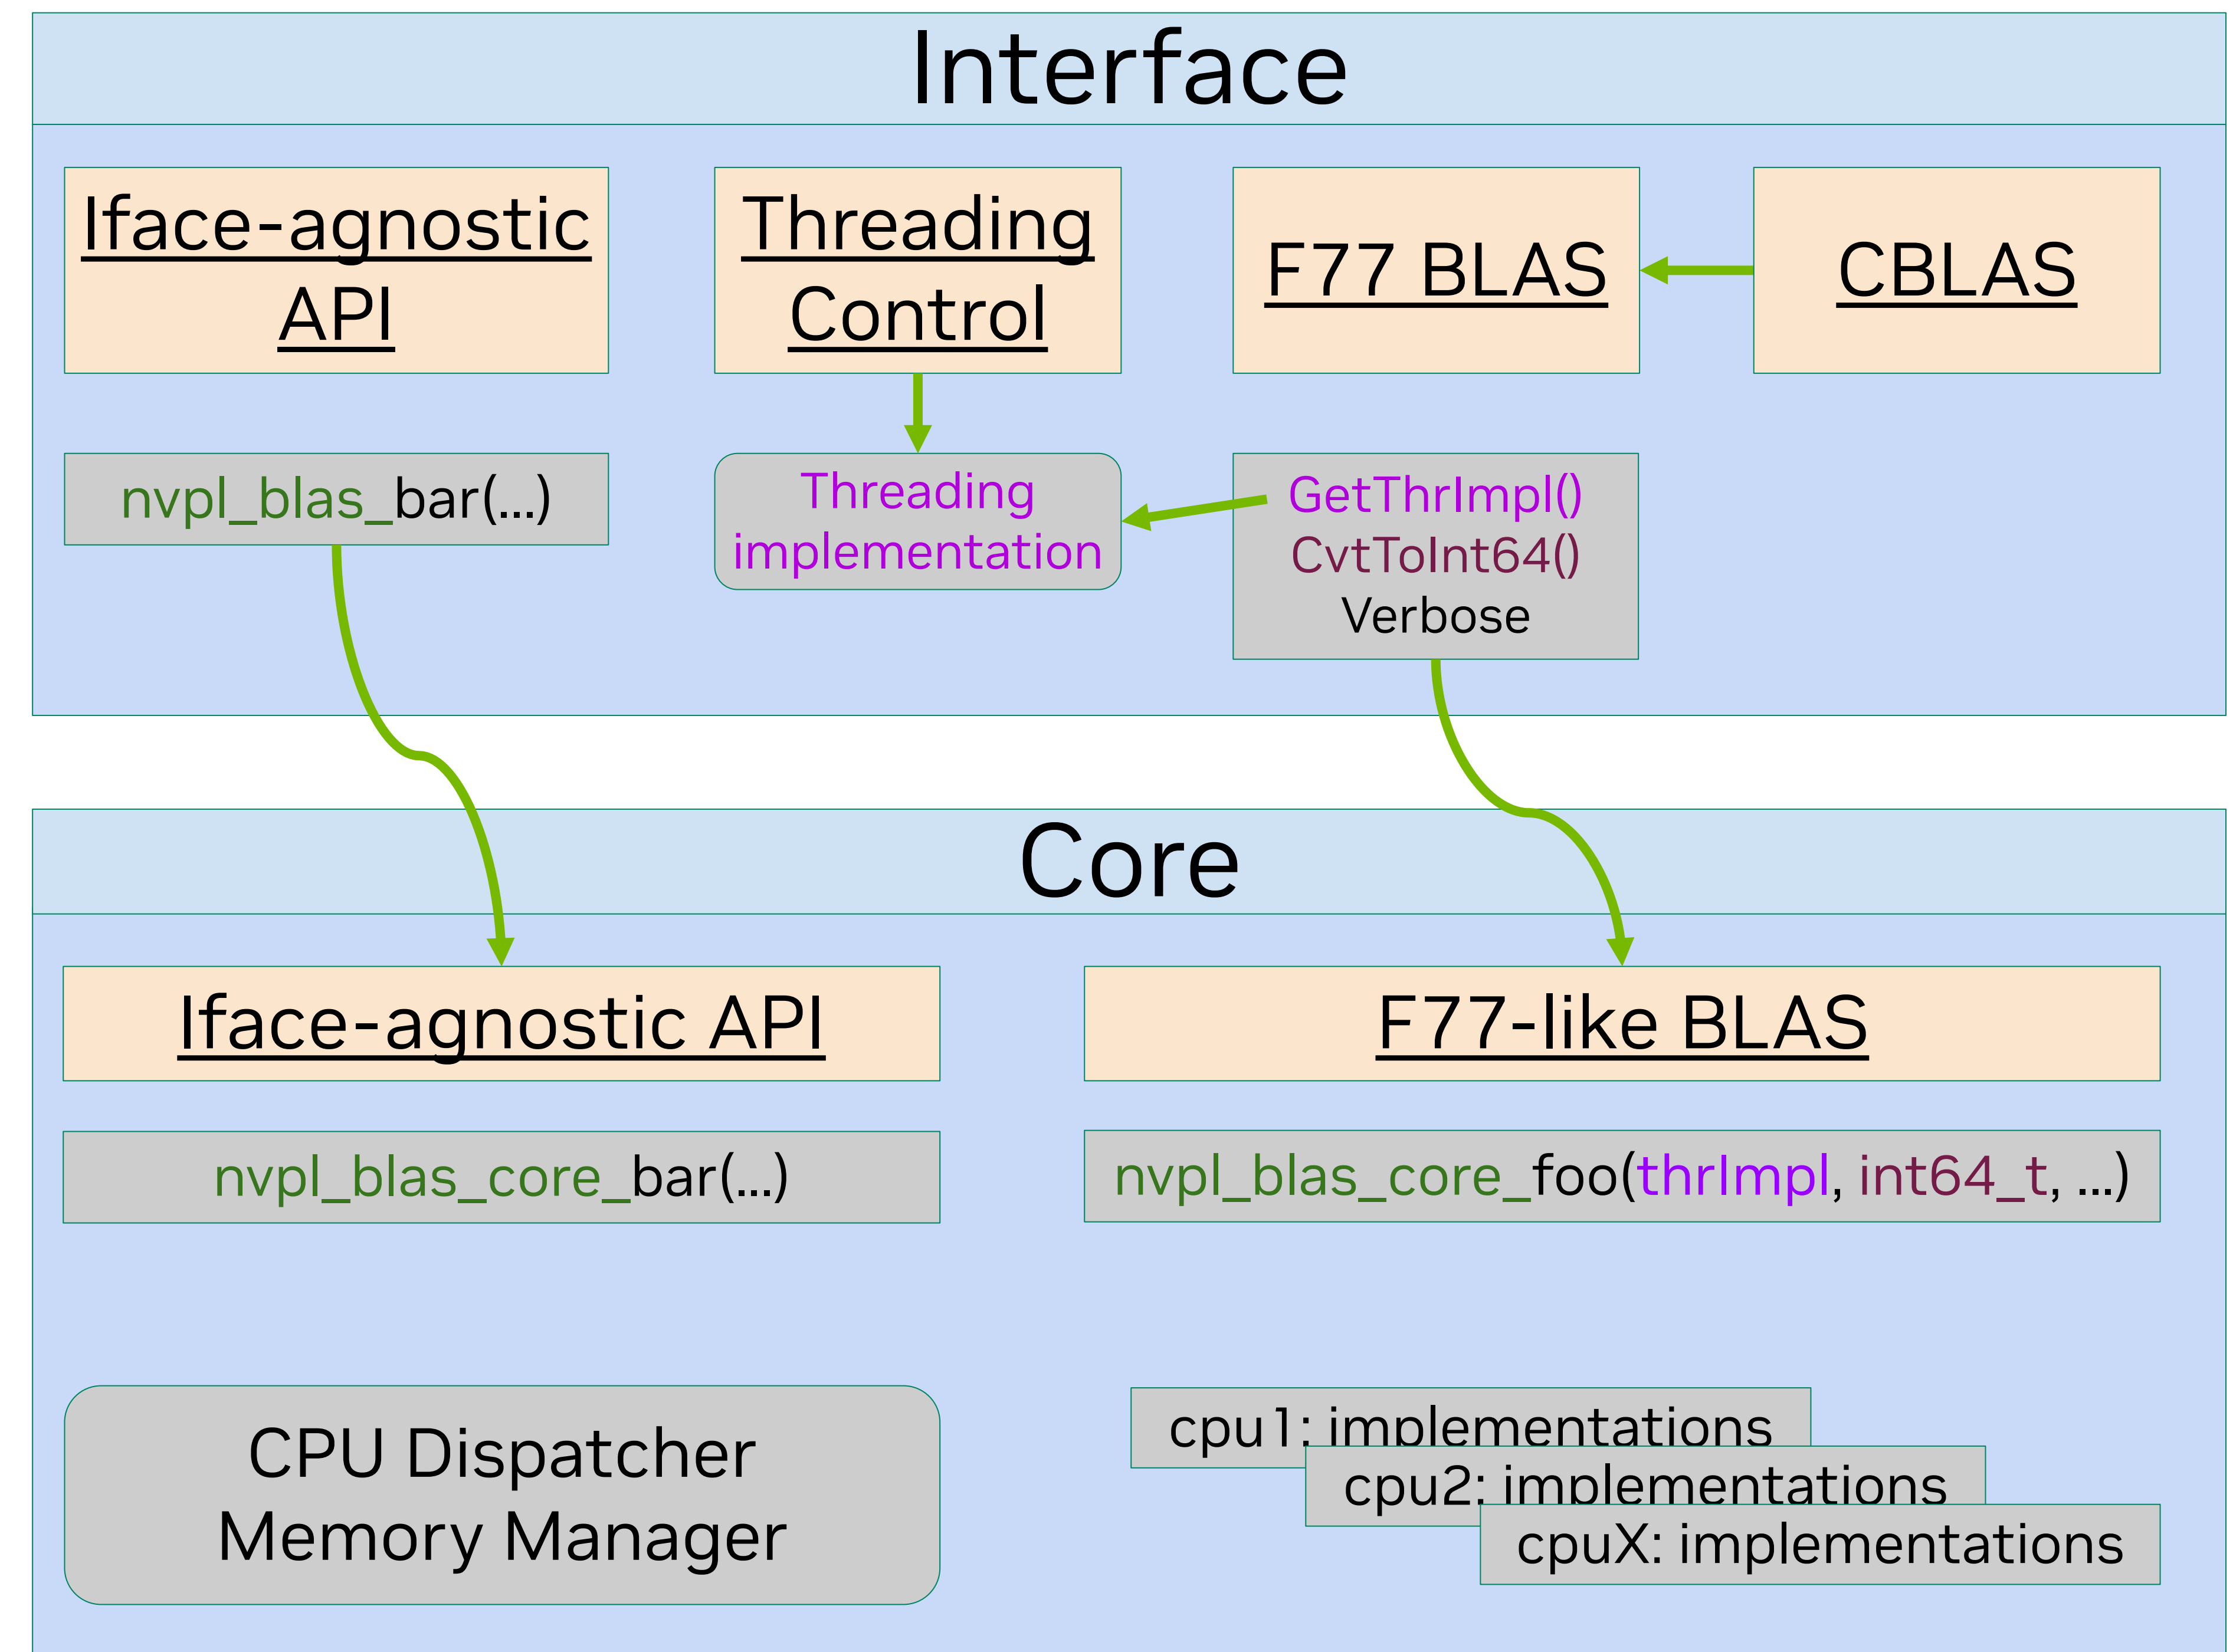

**Name:** libnvpl\_blas\_core.so

**Symbol mangling:** nvpl\_blas\_core\_\*

**Responsibilities:**

- Actual BLAS implementations (all int64)
- CPU dispatcher
- Memory manager
- Other service functionality

**Depends:** libc, lpthread, lm

# Optimizations

## Grace $\mu$ -kernel

- Very similar to a typical Armv8-A kernel, e.g. Cortex A57
- $\mu$ -kernels are written in assembler
  - Statically generated using Python to easily adjust blocking, data types, and other factors
- Most gains come from proper memory prefetches
  - Upside is around 5-10%

```
# MR = 8 (alternative: 6)
# NR = 6 (alternative: 8)
# KC = 512
```

```
 $\mu$ dgemm_MRxNRxKC():
```

```
VC(0:6,0:4) = 0
```

```
.L_loop_k
```

```
for uk = 0 .. 4:
```

```
LD1 {VA(0).2d - VA(3).2d}, [ptrA], #64
```

```
LD1 {VB(0).2d - VB(2).2d}, [ptrB], #48
```

```
for n = 0 .. 6: # NR
```

```
for m = 0 .. 4: # MR/2
```

```
FMLA VC(n, m).2d, VA(m).2d, VB(n / 2).d[n % 2]
```

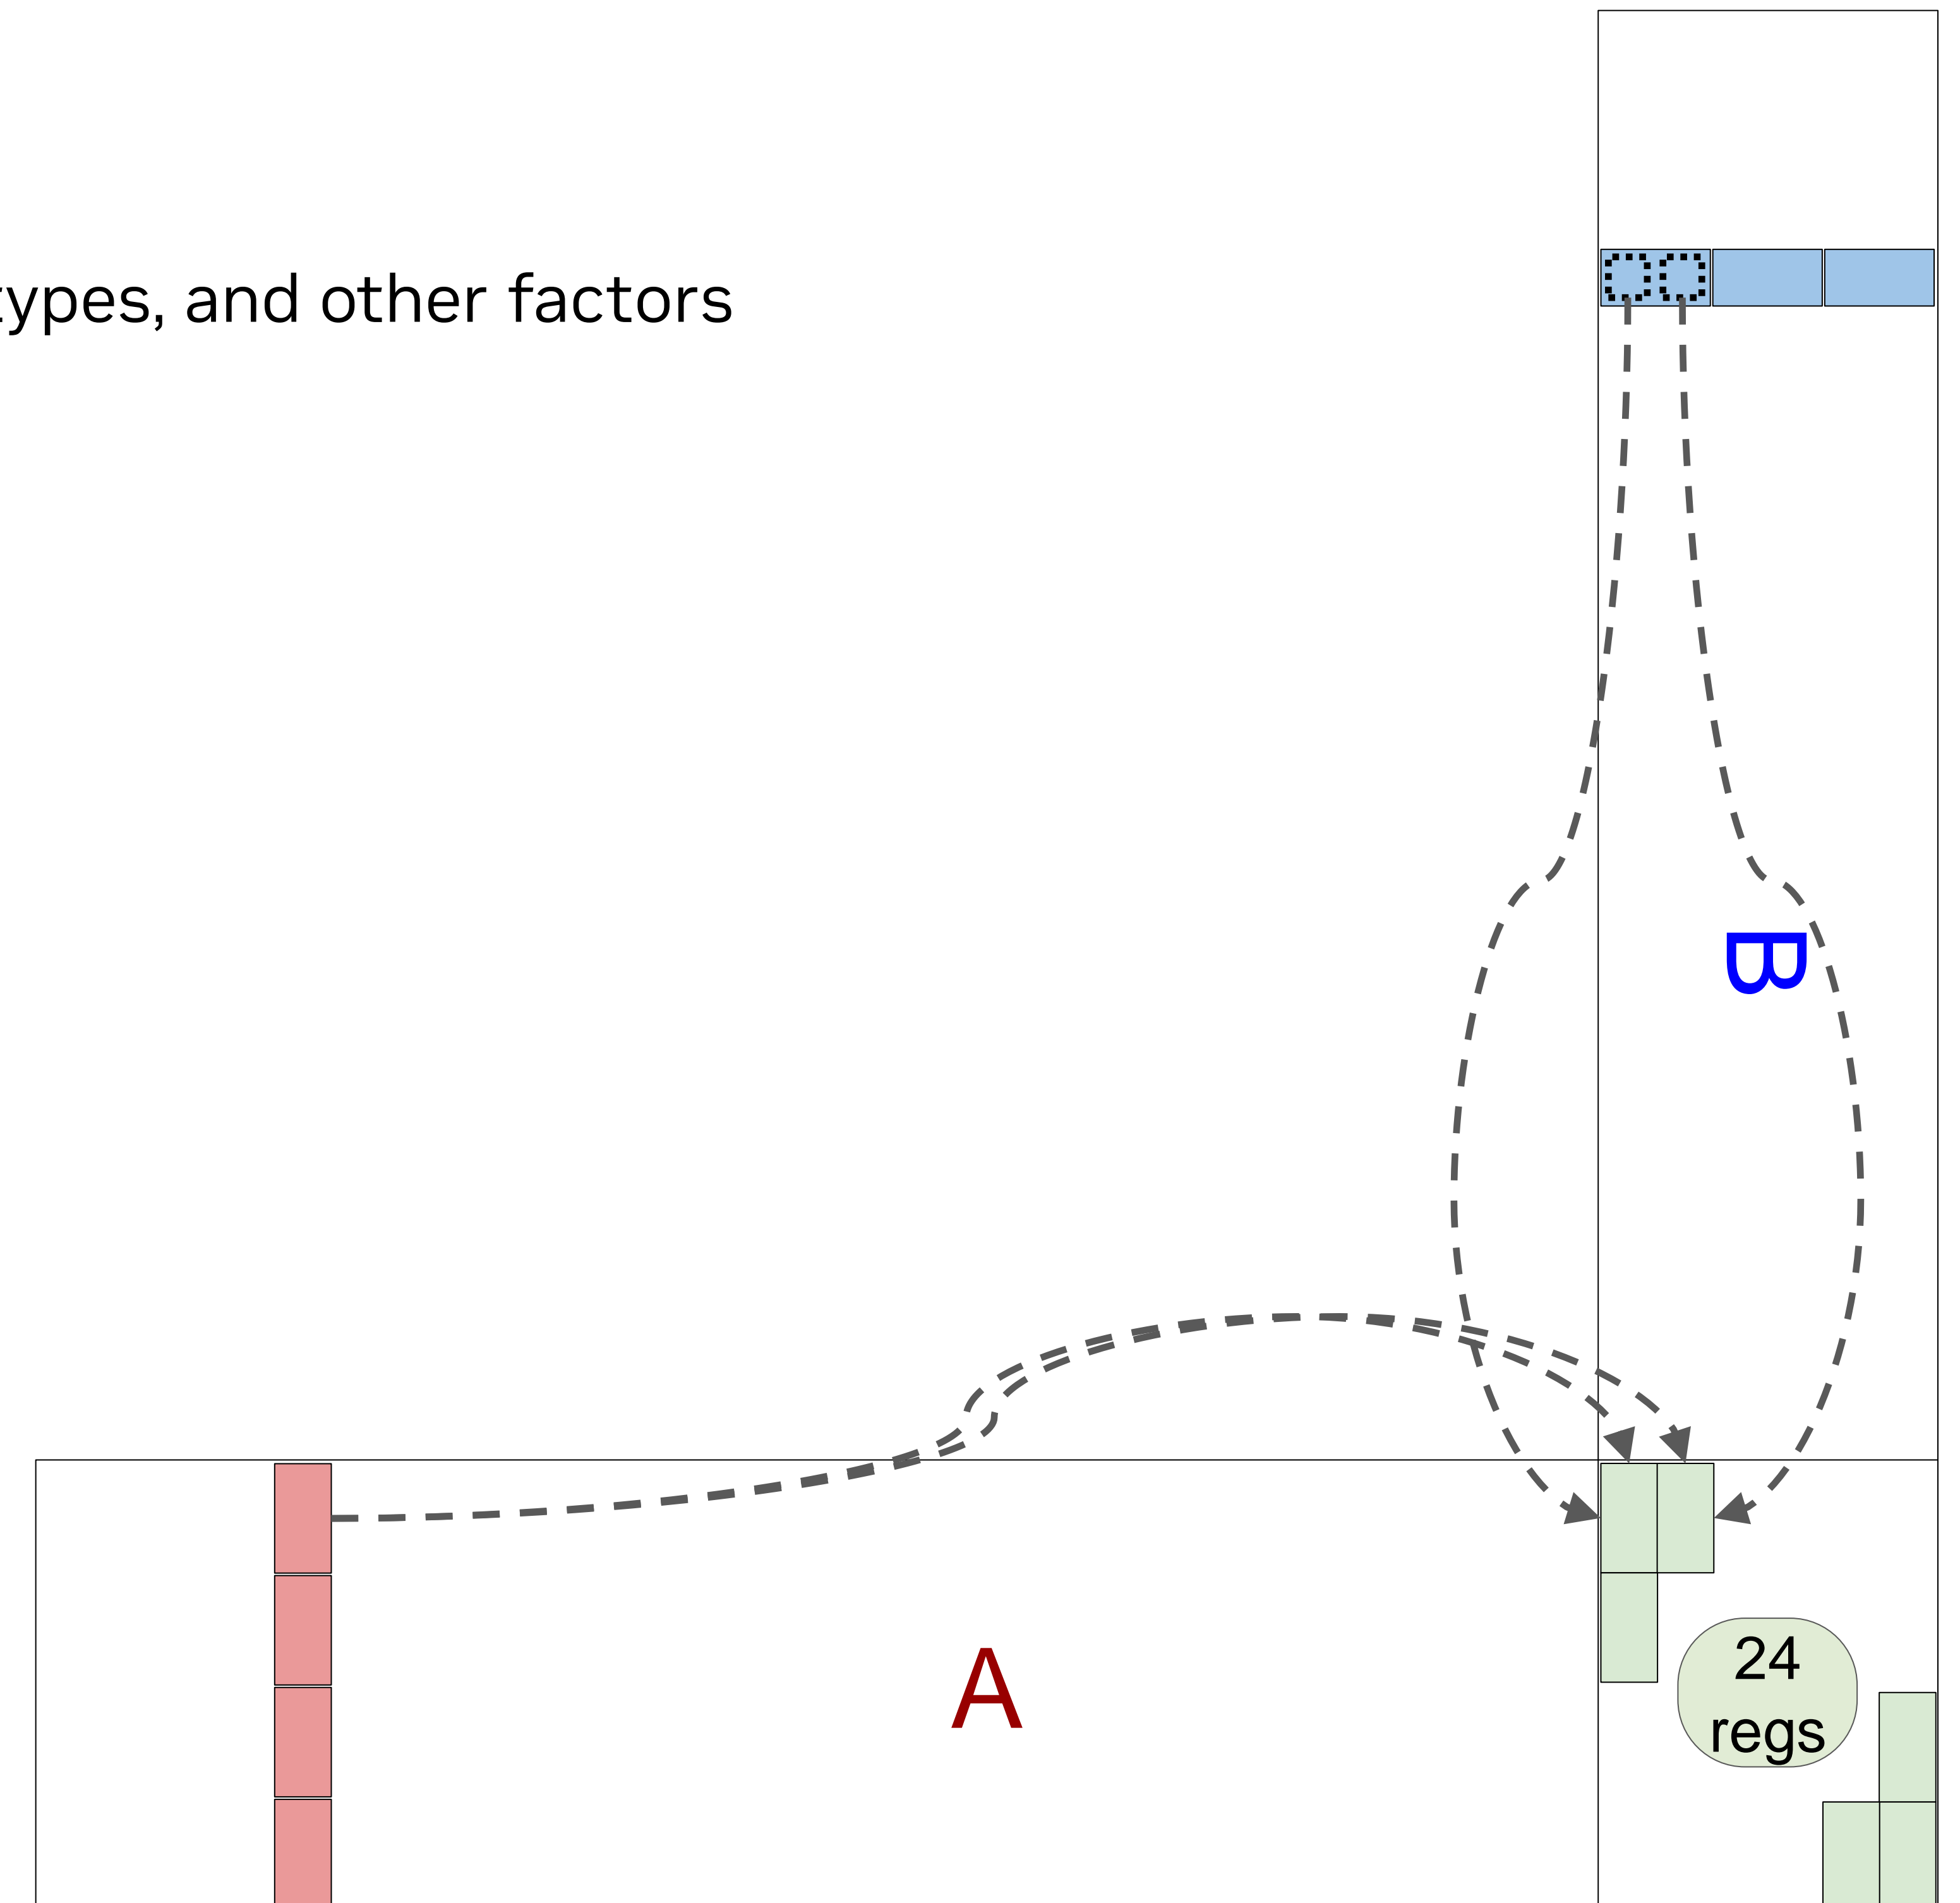

```
SUB xk, xk, 4
```

```
JNZ xk, .L_loop_k
```

```
Cr[:, :] = alpha × VC[:, :] + beta × Cr[:, :]
```

# Optimizations

Grace  $\mu$ -kernel

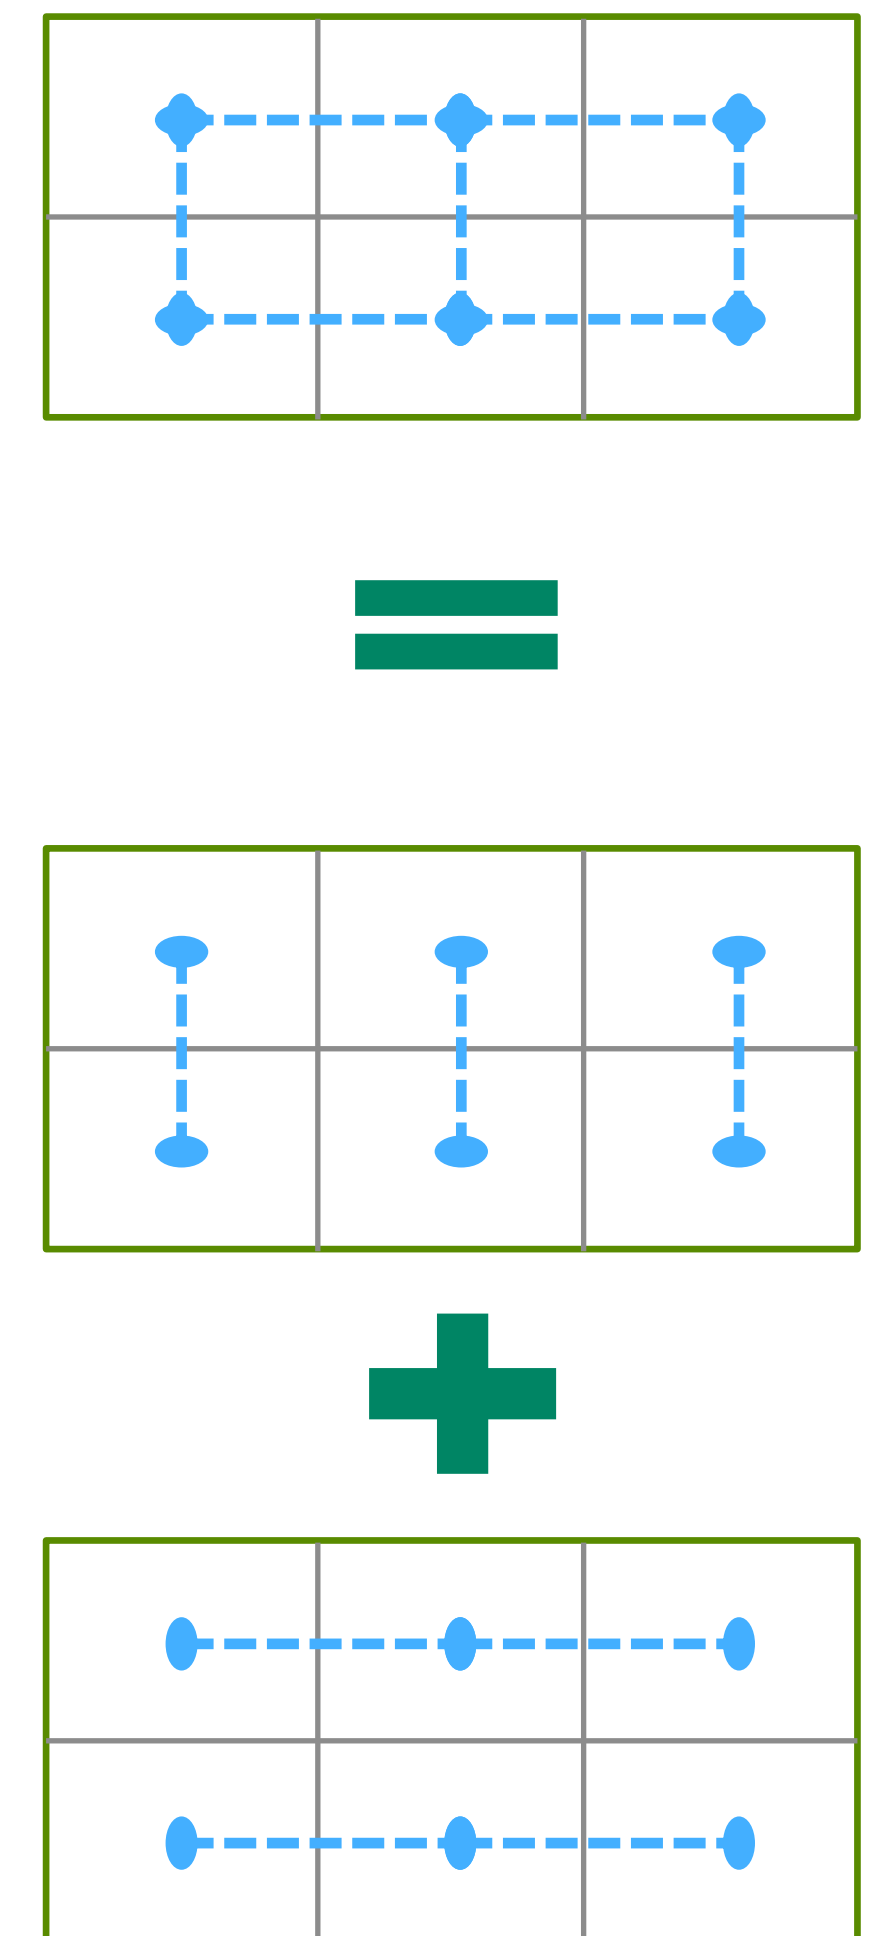

# Optimizations

## Reducing Synchronization Overheads

- Asynchronous creation of thread info (thrinfo\_t) tree
- Faster broadcast
  - Avoid 1 of 2 barriers by altering the shared space for sent object
- Replace 1 barrier for N\*M threads with N independent barriers for M threads
  - At matrix B packing, as there will be M barriers for N threads at matrix A packing
- Replace BLIS allocator with glibc malloc
  - Consider improving/reimplementing the allocator or using something like tcmalloc/jemalloc/etc.
- Some implementation rework to avoid redundant barriers

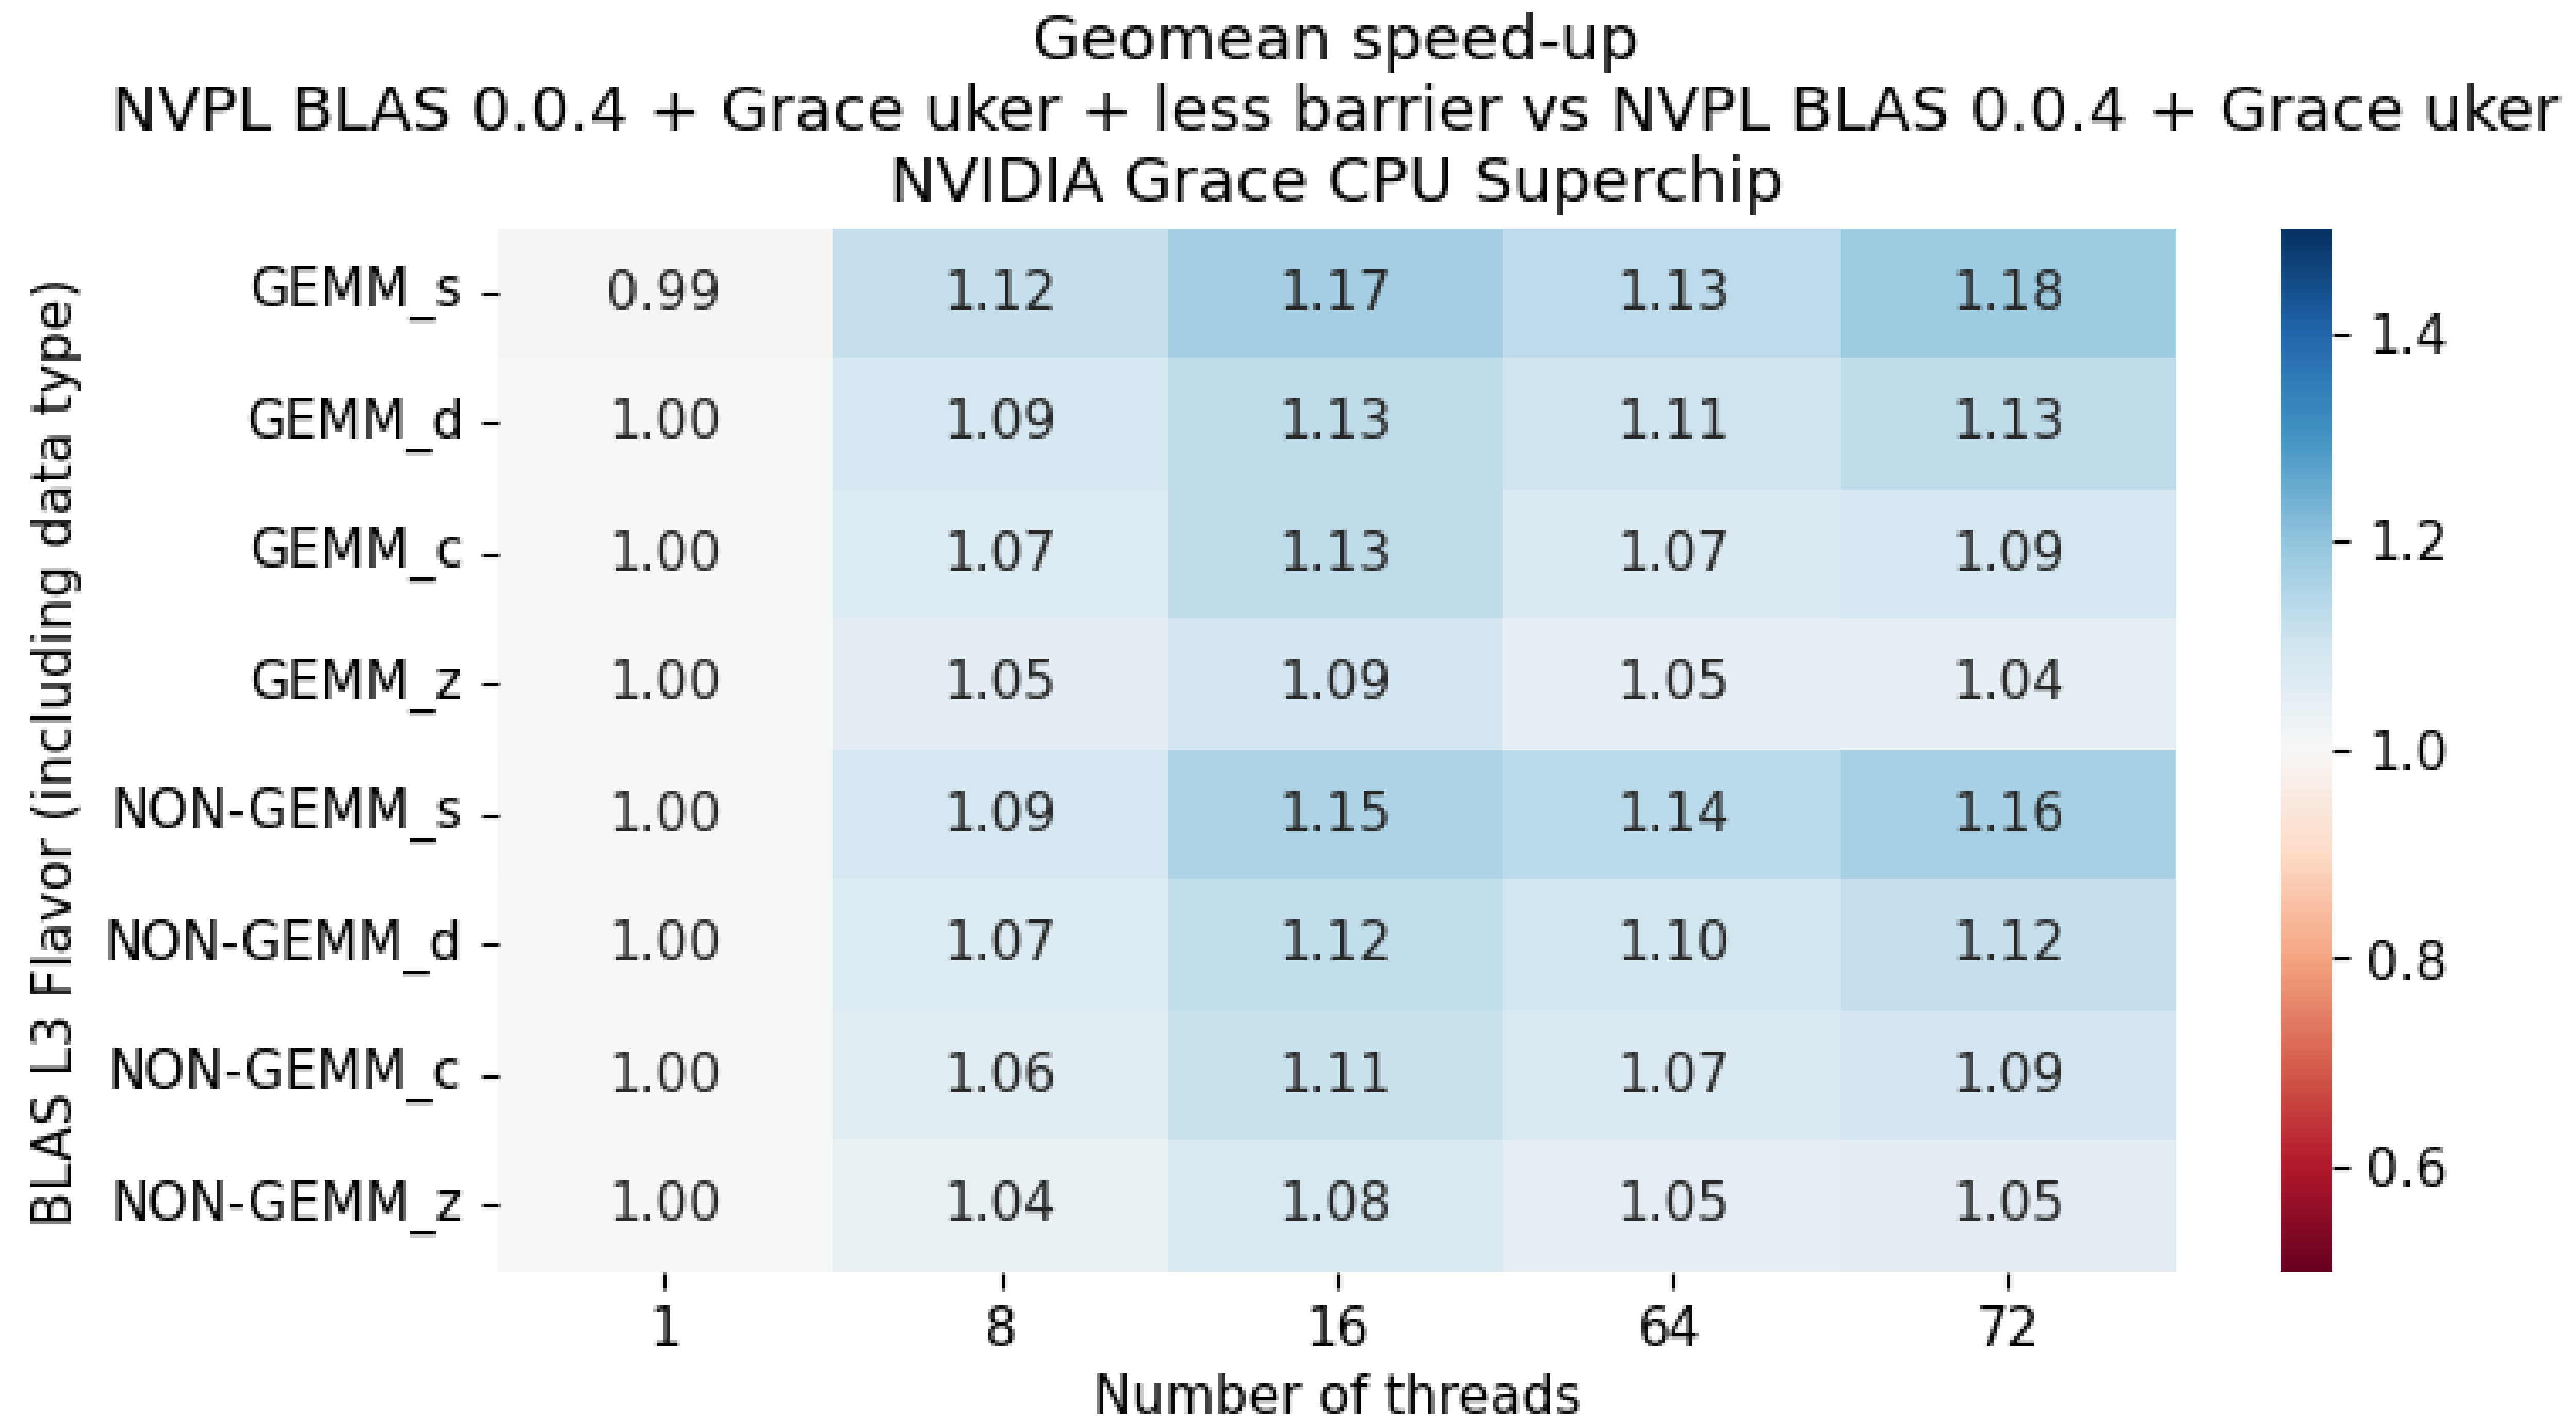

### Execution

```
l3_int() → gemm_blk_var2() →  
l3_int() → gemm_blk_var3() →  
l3_int() → [barrier()] → l3_pack_b() → [barrier()] →  
l3_int() → gemm_blk_var1() →  
l3_int() → [barrier()] → l3_pack_a() → [barrier()] →  
l3_int() → gemm_ker_var2() →  
→  
μgemm()
```

# Optimizations

Reducing Synchronization Overheads

# Optimizations

## Reducing Framework Overheads

Replace BLIS abstraction for computing BLAS Level 3 operations for GEMM with a direct implementation

- This gives the best performance.
- Driver is only 500 lines of code.
- Tried to optimize the abstractions.
  - No luck up until now.
  - Might need to do the same for the remaining BLAS Level 3 ops.

### GEMM Implementation. Practice

```

Precision: d, Number of threads: 64

# Conclusion and Next Steps

- NVPL BLAS is based on BLIS with few library architecture extensions to suite binary distribution model
- BLIS is a very powerful and flexible framework with amazing code reuse
- Abstractions and flexibility don't come for free
- Nvidia Grace CPU doesn't require complicated low-level programming

## NVPL BLAS next steps

- Extend the functionality
- Continue performance optimizations
  - Small shaped GEMMs
  - Non-GEMM BLAS Level 3
  - Improving thread decomposition
  - Direct complex GEMM implementation
  - BLAS Level 1 and 2
