Analysis

CRCs

Summary

- Error Detecting Codes (EDCs) detect errors that may be introduced when data is received at the destination from the source.

Terminology

- Sender - where the data is augmented with a computed tag (converted into a codeword)
- Receiver - where it is checked whether the received message is a legal codeword or not

Why Do We Need To Analyze EDCs using ACL2?

- Need to trust their correctness and know their limitations
- Come up with a general framework that can be used for proofs of the properties of all EDCs

What Does The Analysis Of EDCs Involve?

Introduction

EDCs

Analysis?

Formalization

Soundness

Completeness

Strength

Analysis

CRCs

Summary

- **Receiver's Point of View:** the receiver's concern is to correctly detect whether the received codeword is legal or not.
- **Analyzer's Point of View:** the analyzer's concern is to determine what kinds of errors the EDC scheme can detect.

What Does The Analysis Of EDCs Involve?

Introduction

EDCs

Analysis?

Formalization

Soundness

Completeness

Strength

Analysis

CRCs

Summary

- Soundness (Receiver's Point of View)
- Completeness (Receiver's Point of View)
- Strength (Analyzer's Point of View)

Soundness

An informal description of soundness of an EDC:

- Given an uncorrupted transmission of data, the error control scheme ought to be able to report that the received data is error-free.

- No Error Detected \Rightarrow Received Codeword is Legal

Completeness

An informal description of completeness of an EDC:

- Given a corrupted transmission of data, the error control scheme ought to be able to report that the data is corrupted.
- Error Detected \Rightarrow Received Codeword is Not Legal

More About Soundness

Introduction

EDCs

Analysis?

Formalization

Soundness

Completeness

Strength

Analysis

CRCs

Summary

- Merely knowing that the received codeword is legal is not enough to guarantee that the transmission was error-free.
- We need to analyze the strengths and limitations of the EDC to state under *what* conditions can we know absolutely that the transmission was error-free when it is reported as error-free.

Strength

Informally, determining the strength of an EDC involves the specification of:

- The types of errors that the EDC can *always* detect
- Includes the analysis of the general robustness of the EDC like detecting burst errors or more specific analysis like detection of isolated two bit errors, etc

- 4 Summary

Formalization

In this section, we will formalize the concepts of soundness, completeness and strength of an error detecting scheme.

Notation Used

Term	Description
Det	predicate that detects whether the received message is a codeword
E	function that encodes a message
D	function that decodes a message
Env	the predicate which specifies under what environment the EDC works

 - Strength
- 3 Analysis Of Some EDCs
 - Analysis of CRCs
- 4 Summary

Soundness

Let n be the number of bits in the data the sender encodes and m be the message received by the receiver.

If $\text{Env}(n,m)$ holds and $\text{Det}(m)$ is false, then there exists an m' such that $D(m) = m'$ and $E(m') = m$.

- 4 Summary

Completeness

Let n be the number of bits in the data the sender encodes and m be the message received by the receiver.

If $\text{Env}(n,m)$ holds and if $\text{Det}(m)$ is true, then there exists no m' such that $D(m) = m'$ and $E(m') = m$.

- 3 Analysis Of Some EDCs
 - Analysis of CRCs
- 4 Summary

Strength

Let s be the encoded message sent by the sender and r be the message received by the receiver such that r is not equal to s . $\text{Errors}(s,r)$ specifies the transformations s undergoes to become r such that r is not another legal codeword.

If $\text{Errors}(s,r)$ holds, then $\text{Det}(r)$ will be true.

CRCs

Summary

- To arrive at a general framework for EDC analysis, one must examine some specific EDCs.
 - Even Parity Check
 - Weighted Checksum
 - Cyclic Redundancy Check (CRC)
- In particular, we will look at the Soundness and Completeness of Cyclic Redundancy Checks.

Analysis

CRCs

Summary

- CRCs are cyclic linear codes based on division in the ring of polynomials over $\text{GF}(2)$.
- CRC division, like ordinary long division, can be done by shifts and subtraction (over $\text{GF}(2)$).

- Addition/Subtraction: XOR Operation

+	1	0
1	0	1
0	1	0

- Multiplication: AND Operation

*	1	0
1	1	0
0	0	0

For CRCs to work, the sender and receiver agree on:

- the generator polynomial g_p , which is the divisor in the GF(2) division process
- the augment a - the length of a is one less than the length of g_p . a is augmented to the message at the sender's end
- the number of bits n of the message to be encoded at a time by the sender - and hence, also the number of bits of the received message to be decoded at a time by the receiver

For CRCs to work, the sender and receiver agree on:

- the generator polynomial g_p , which is the divisor in the GF(2) division process
- the augment a - the length of a is one less than the length of g_p . a is augmented to the message at the sender's end
- the number of bits n of the message to be encoded at a time by the sender - and hence, also the number of bits of the received message to be decoded at a time by the receiver

For CRCs to work, the sender and receiver agree on:

- the generator polynomial g_p , which is the divisor in the GF(2) division process
- the augment a - the length of a is one less than the length of g_p . a is augmented to the message at the sender's end
- the number of bits n of the message to be encoded at a time by the sender - and hence, also the number of bits of the received message to be decoded at a time by the receiver

An Example

Let gp be 101 and m' be 1001. Hence, n is 4.

a should be of length 2.

Let a be 11.

An Example

Let gp be 101 and m' be 1001. Hence, n is 4.

a should be of length 2.

Let a be 11.

An Example

Let gp be 101 and m' be 1001. Hence, n is 4.

a should be of length 2.

Let a be 11.

Sender's End

$$gp = 101$$

$$m' = 1001$$

$$a = 11$$

$$\begin{array}{r}

 - Completeness
 - Strength
- 3 Analysis Of Some EDCs
 - Analysis of CRCs
- 4 Summary

Summary

- As of now, we have done a formal analysis of soundness, completeness and strengths of some EDCs.
- We aim to arrive at a general framework to prove the correctness and strengths of all EDCs.
- Doing a similar analysis for Error Correcting Codes would be interesting too.
