

Topic 19

Binary Search Trees

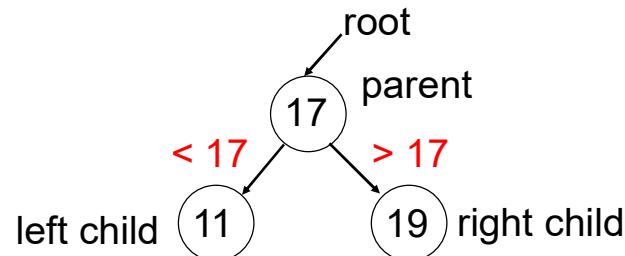

"Yes. Shrubberries are my trade. I am a shrubber. My name is 'Roger the Shrubby'. I arrange, design, and sell shrubberries."

-Monty Python and The Holy Grail

Binary Search Trees

- A binary search tree is a binary tree in which **every node's** left subtree holds values less than the node's value, and every right subtree holds values greater than the node's value.
- A new node is added as a leaf.

The Problem with Linked Lists

- Accessing an item from a linked list takes $O(N)$ time for an arbitrary element
- Binary trees can improve upon this and reduce access to $O(\log N)$ time for the average case
- Expands on the binary search technique and allows insertions and deletions
- Worst case degenerates to $O(N)$ but this can be avoided by using balanced trees (AVL, Red-Black)

BST Insertion

- Add the following values one at a time to an initially empty binary search tree using the simple algorithm:

50 90 20 78 10 20 28 -25

- What is the resulting tree?

Traversals

- What is the result of an inorder traversal of the resulting tree?
- How could a preorder traversal be useful?

CS314

Binary Search Trees

5

Clicker 1

- After adding N distinct elements in random order to a Binary Search Tree what is the expected height of the tree? (using the simple insertion algorithm)

- A. $O(\log N)$
- B. $O(N^{1/2})$
- C. $O(N)$
- D. $O(N \log N)$
- E. $O(N^2)$

CS314

Binary Search Trees

6

Clicker 2

- After adding N distinct elements to a Binary Search Tree what is the **worst case** height of the tree? (using the simple insertion algorithm)

- A. $O(\log N)$
- B. $O(N^{1/2})$
- C. $O(N)$
- D. $O(N \log N)$
- E. $O(N^2)$

CS314

Binary Search Trees

7

Worst Case Performance

- Insert the following values into an initially empty binary search tree using the simple, naïve algorithm:

2 3 5 7 11 13 17

- What is the height of the tree?
- What is the worst case height of a BST?

Binary Search Trees

8

Node for Binary Search Trees

```
public class BSTNode<E extends Comparable<E>> {  
    private Comparable<E> myData;  
    private BSTNode<E> myLeft;  
    private BSTNode<E> myRight;  
  
    public BinaryNode(E item)  
    {        myData = item;    }  
  
    public E getValue()  
    {        return myData;    }  
  
    public BinaryNode<E> getLeft()  
    {        return myLeft;    }  
  
    public BinaryNode<E> getRight()  
    {        return myRight;    }  
  
    public void setLeft(BSTNode<E> b)  
    {        myLeft = b;    }  
    // setRight not shown
```

CS314 }

Binary Search Trees

9

More on Implementation

- ▶ Many ways to implement BSTs
- ▶ Using nodes is just one and even then many options and choices

```
public class BinarySearchTree<E extends Comparable<E>> {  
  
    private BSTNode<E> root;  
    private int size;
```

Add an Element, Recursive

Binary Search Trees

12

Clicker 3

- What are the best case and worst case order to add N distinct elements, one at a time, to an initially empty binary search tree using the simple add algorithm?

	Best	Worst
A.	$O(N)$	$O(N)$
B.	$O(N\log N)$	$O(N\log N)$
C.	$O(N)$	$O(N\log N)$
D.	$O(N\log N)$	$O(N^2)$
E.	$O(N)$	$O(N^2)$

```
// given int[] data
// no duplicates in
// data
BST<Integer> b =
    new BST<Integer>();
for(int x : data)
    b.add(x);
```

13

Performance of Binary Trees

- For the three core operations (add, access, remove) a binary search tree (BST) has an average case performance of $O(\log N)$
- Even when using the *naïve insertion / removal algorithms*
 - no checks to maintain balance
 - balance achieved based on the randomness of the data inserted

CS314

Binary Search Trees

14

Remove an Element

- Five (four?) cases
 - not present
 - node is a leaf, 0 children (easy)
 - node has 1 child, left or right (easy)
 - node has 2 children ("interesting")

CS314

Binary Search Trees

15

Properties of a BST

- The minimum value is in the left most node
- The maximum value is in the right most node
 - useful when removing an element from the BST

CS314

Binary Search Trees

16

Alternate Implementation

- In class examples of dynamic data structures have relied on *null terminated ends*.
 - Use null to show end of list or no children
- Alternative form
 - use structural recursion and polymorphism

CS314

Binary Search Trees

17

BST Interface

```
public interface BST<E extends Comparable<? super E>> {  
  
    public int size();  
    public boolean contains(E obj);  
    public BST<E> add(E obj);  
}
```

CS314

Binary Search Trees

18

EmptyBST

```
public class EmptyBST<E extends Comparable<? super E>>  
    implements BST<E> {  
  
    private static final EmptyBST theOne = new EmptyBST();  
  
    private EmptyBST() {}  
  
    public static EmptyBST getEmptyBST(){ return theOne; }  
  
    public BST<E> add(E obj) { return new NEBST(obj); }  
  
    public boolean contains(E obj) { return false; }  
  
    public int size() { return 0; }  
}
```

CS314

Binary Search Trees

19

Non Empty BST – Part 1

```
public class NEBST <E extends Comparable<? super E>> implements BST<E> {  
  
    private E data;  
    private BST left;  
    private BST right;  
  
    public NEBST(E d) {  
        data = d;  
        right = EmptyBST.getEmptyBST();  
        left = EmptyBST.getEmptyBST();  
    }  
  
    public BST add(E obj) {  
        int direction = obj.compareTo( data );  
        if ( direction < 0 )  
            left = left.add( obj );  
        else if ( direction > 0 )  
            right = right.add ( obj );  
        return this;  
    }  
}
```

CS314

Binary Search Trees

20

Non Empty BST – Part 2

```
public boolean contains(E obj){  
    int dir = obj.compareTo(data);  
    if( dir == 0 )  
        return true;  
    else if (dir < 0)  
        return left.contains(obj);  
    else  
        return right.contains(obj);  
}  
  
public int size() {  
    return 1 + left.size() + right.size();  
}
```
